Abstract

This document adds abbreviations to "DNS Terminology" (RFC 8499) that relate to DNS running over various transports, as well as abbreviations for DNS resolution at traditional and non-traditional locations.

[[ This is an early attempt at these terms. They will probably be improved over time. []]

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 25, 2019.

The following abbreviations are added to Section 6 of [RFC8499].

Do53: DNS over UDP or TCP as defined in [RFC1035] and its successors. Do53 applies to DNS communication between stub resolvers and recursive resolvers, and between recursive resolvers and authoritative servers.

DoH: DNS over HTTPS as defined in [RFC8484] and its successors.

DoT: DNS over TLS as defined in [RFC7858] and its successors.

RDoT: RDoT specifically means DoT for transport between stub resolvers and recursive resolvers. This term is necessary because it is expected that DNS over TLS will later be defined as a transport between recursive resolvers and authoritative servers. The "R" in RDoT stands for "recursive", the endpoint.

ADoT: If DoT is later defined as the transport between recursive resolvers and authoritative servers, ADoT specifically means DoT for transport between recursive resolvers and authoritative servers. The "A" in ADoT stands for "authoritative", the endpoint.

DaT: DNS resolution between a stub resolver and the recursive resolver at the the traditional location configured in the operating system. The "T" stands for "traditional". DaT is typically configured by DHCP, IPv6 router advertisements, or an administrator editing a configuration file on a host. If [I-D.ietf-doh-resolver-associated-doh] becomes standardized, DoH to the DoH server associated with the traditional resolver would also be considered DaT.

DaO: DNS resolution between a stub resolver and a recursive resolver at other than the traditional location configured in the operating system. DaO can be configured by a user changing the configuration on a host (such as editing /etc/resolv.conf), or an application

running RDoT or DoH to a resolver that is not the same as the traditional location configured in the operating system.
