Use of the SHAKE One-way Hash Functions in the Cryptographic Message Syntax (CMS)
draft-ietf-lamps-cms-shakes-09

Abstract

This document describes the conventions for using the SHAKE family of hash functions with the Cryptographic Message Syntax (CMS) as one-way hash functions with the RSA Probabilistic signature and ECDSA signature algorithms, as message digests and message authentication codes. The conventions for the associated signer public keys in CMS are also described.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 13, 2019.

1.  Change Log

[ EDNOTE: Remove this section before publication. ]

o  draft-ietf-lamps-cms-shake-09:
   *  Fixed minor text nit.
   *  Updates in Sec Considerations section.

o  draft-ietf-lamps-cms-shake-08:
   *  id-shake128-len and id-shake256-len were replaced with id-sha128 with 32 bytes output length and id-shake256 with 64 bytes output length.
   *  Fixed a discrepancy between section 3 and 4.4 about the KMAC OIDs that have parameters as optional.

o  draft-ietf-lamps-cms-shake-07:
   *  Small nit from Russ while in WGLC.
o draft-ietf-lamps-cms-shake-06:
  * Incorporated Eric’s suggestion from WGLC.

o draft-ietf-lamps-cms-shake-05:
  * Added informative references.
  * Updated ASN.1 so it compiles.
  * Updated IANA considerations.

o draft-ietf-lamps-cms-shake-04:
  * Added RFC8174 reference and text.
  * Explicitly explained why RSASSA-PSS-params are omitted in section 4.2.1.
  * Simplified Public Keys section by removing redundant info from RFCs.

o draft-ietf-lamps-cms-shake-03:
  * Removed paragraph suggesting KMAC to be used in generating k in Deterministic ECDSA. That should be RFC6979-bis.
  * Removed paragraph from Security Considerations that talks about randomness of k because we are using deterministic ECDSA.
  * Completed ASN.1 module and fixed KMAC ASN.1 based on Jim’s feedback.
  * Text fixes.

o draft-ietf-lamps-cms-shake-02:
  * Updates based on suggestions and clarifications by Jim.
  * Started ASN.1 module.

o draft-ietf-lamps-cms-shake-01:
  * Significant reorganization of the sections to simplify the introduction, the new OIDs and their use in CMS.
  * Added new OIDs for RSASSA-PSS that hardcodes hash, salt and MGF, according the WG consensus.
The Cryptographic Message Syntax (CMS) [RFC5652] is used to digitally sign, digest, authenticate, or encrypt arbitrary message contents. This specification describes the use of the SHAKE128 and SHAKE256 specified in [SHA3] as new hash functions in CMS. In addition, it describes the use of these functions with the RSASSA-PSS signature algorithm [RFC8017] and the Elliptic Curve Digital Signature Algorithm (ECDSA) [X9.62] with the CMS signed-data content type.

In the SHA-3 family, two extendable-output functions (SHAKEs), SHAKE128 and SHAKE256, are defined. Four other hash function instances, SHA3-224, SHA3-256, SHA3-384, and SHA3-512 are also defined but are out of scope for this document. A SHAKE is a variable length hash function defined as SHAKE(M, d) where the output is a d-bits long digest of message M. The corresponding collision and second preimage resistance strengths for SHAKE128 are min(d/2,128) and min(d,128) bits respectively. And, the corresponding collision and second preimage resistance strengths for SHAKE256 are min(d/2,256) and min(d,256) bits respectively.

A SHAKE can be used in CMS as the message digest function (to hash the message to be signed) in RSASSA-PSS and ECDSA, message authentication code and as the mask generating function in RSASSA-PSS. This specification describes the identifiers for SHAKEs to be used in CMS and their meaning.

2.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP.

3. Identifiers

This section defines six new object identifiers (OIDs) for using SHAKE128 and SHAKE256 in CMS.

EDNOTE: If PKIX draft is standardized first maybe we should not say the identifiers are new for the RSASSA-PSS and ECDSA.

Two object identifiers for SHAKE128 and SHAKE256 hash functions are defined in [shake-nist-oids] and we include them here for convenience.

```
id-shake128 OBJECT IDENTIFIER ::= { joint-iso-itu-t(2)  
country(16) us(840) organization(1) gov(101) csor(3)  
nistAlgorithm(4) 2 11 }

id-shake256 OBJECT IDENTIFIER ::= { joint-iso-itu-t(2)  
country(16) us(840) organization(1) gov(101) csor(3)  
nistAlgorithm(4) 2 12 }
```

In this specification, when using the id-shake128 or id-shake256 algorithm identifiers, the parameters MUST be absent. That is, the identifier SHALL be a SEQUENCE of one component, the OID.

We define two new identifiers for RSASSA-PSS signatures using SHAKEs.

```
id-RSASSA-PSS-SHAKE128 OBJECT IDENTIFIER ::= { TBD1 }

id-RSASSA-PSS-SHAKE256 OBJECT IDENTIFIER ::= { TBD2 }
```

[ EDNOTE: "TBD1", "TBD2" will be specified by NIST later. ]

The same RSASSA-PSS algorithm identifiers can be used for identifying public keys and signatures.

We define two new algorithm identifiers of ECDSA signatures using SHAKEs.
The parameters for the four RSASSA-PSS and ECDSA identifiers MUST be absent. That is, each identifier SHALL be a SEQUENCE of one component, the OID.

Two new object identifiers for KMACs using SHAKE128 and SHAKE256 are defined below.

\[
\begin{align*}
\text{id-KmacWithSHAKE128} & \quad \text{OBJECT IDENTIFIER ::= } \{ \text{joint-iso-itu-t}(2) \\
& \quad \quad \text{country}(16) \ us(840) \ \text{organization}(1) \ \text{gov}(101) \ \text{csor}(3) \\
& \quad \quad \text{nistAlgorithm}(4) \ 2 \ 19 \}
\end{align*}
\]

\[
\begin{align*}
\text{id-KmacWithSHAKE256} & \quad \text{OBJECT IDENTIFIER ::= } \{ \text{joint-iso-itu-t}(2) \\
& \quad \quad \text{country}(16) \ us(840) \ \text{organization}(1) \ \text{gov}(101) \ \text{csor}(3) \\
& \quad \quad \text{nistAlgorithm}(4) \ 2 \ 20 \}
\end{align*}
\]

The parameters for id-KmacWithSHAKE128 and id-KmacWithSHAKE256 are OPTIONAL.

Section 4.1, Section 4.2.1, Section 4.2.2 and Section 4.4 specify the required output length for each use of SHAKE128 or SHAKE256 in message digests, RSASSA-PSS, ECDSA and KMAC.

4. Use in CMS

4.1. Message Digests

The id-shake128 and id-shake256 OIDs (Section 3) can be used as the digest algorithm identifiers located in the SignedData, SignerInfo, DigestedData, and the AuthenticatedData digestAlgorithm fields in CMS [RFC5652]. The encoding MUST omit the parameters field and the output size, d, for the SHAKE128 or SHAKE256 message digest MUST be 256 or 512 bits respectively.

The digest values are located in the DigestedData field and the Message Digest authenticated attribute included in the signedAttributes of the SignedData signerInfo. In addition, digest values are input to signature algorithms. The digest algorithm MUST be the same as the message hash algorithms used in signatures.
4.2. Signatures

In CMS, signature algorithm identifiers are located in the SignerInfo signatureAlgorithm field of SignedData content type and countersignature attribute. Signature values are located in the SignerInfo signature field of SignedData and countersignature.

Conforming implementations that process RSASSA-PSS and ECDSA with SHAKE signatures when processing CMS data MUST recognize the corresponding OIDs specified in Section 3.

When using RSASSA-PSS or ECDSA with SHAKEs, the RSA modulus and ECDSA curve order SHOULD be chosen in line with the SHAKE output length. In the context of this document SHAKE128 OIDs are RECOMMENDED for 2048 or 3072-bit RSA modulus or curves with group order of 256-bits. SHAKE256 OIDs are RECOMMENDED for 4096-bit RSA modulus and higher or curves with group order of 384-bits and higher.

4.2.1. RSASSA-PSS Signatures

The RSASSA-PSS algorithm is defined in [RFC8017]. When id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256 specified in Section 3 is used, the encoding MUST omit the parameters field. That is, the AlgorithmIdentifier SHALL be a SEQUENCE of one component, id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256. [RFC4055] defines RSASSA-PSS-params that are used to define the algorithms and inputs to the algorithm. This specification does not use parameters because the hash and mask generating algorithm and trailer and salt are embedded in the OID definition.

The hash algorithm to hash a message being signed and the hash and the hash algorithm as the mask generation function used in RSASSA-PSS MUST be the same, SHAKE128 or SHAKE256 respectively. The output-length of the hash algorithm which hashes the message SHALL be 32 or 64 bytes respectively.

The mask generation function takes an octet string of variable length and a desired output length as input, and outputs an octet string of the desired length. In RSASSA-PSS with SHAKEs, the SHAKEs MUST be used natively as the MGF function, instead of the MGF1 algorithm that uses the hash function in multiple iterations as specified in Section B.2.1 of [RFC8017]. In other words, the MGF is defined as the SHAKE128 or SHAKE256 output of the mgfSeed for id-RSASSA-PSS-SHAKE128 and id-RSASSA-PSS-SHAKE256 respectively. The mgfSeed is the seed from which mask is generated, an octet string [RFC8017]. As explained in Step 9 of section 9.1.1 of [RFC8017], the output length of the MGF is emLen - hLen - 1 bytes. emLen is the maximum message length ceil((n-1)/8), where n is the RSA modulus in bits. hLen is 32
and 64-bytes for id-RSASSA-PSS-SHAKE128 and id-RSASSA-PSS-SHAKE256 respectively. Thus when SHAKE is used as the MGF, the SHAKE output length maskLen is \((n - 264)\) or \((n - 520)\) bits respectively. For example, when RSA modulus \(n\) is 2048, the output length of SHAKE128 or SHAKE256 as the MGF will be 1784 or 1528-bits when id-RSASSA-PSS-SHAKE128 or id-RSASSA-PSS-SHAKE256 is used respectively.

The RSASSA-PSS saltLength MUST be 32 or 64 bytes respectively. Finally, the trailerField MUST be 1, which represents the trailer field with hexadecimal value 0xBC [RFC8017].

### 4.2.2. ECDSA Signatures

The Elliptic Curve Digital Signature Algorithm (ECDSA) is defined in [X9.62]. When the id-ecdsa-with-shake128 or id-ecdsa-with-shake256 (specified in Section 3) algorithm identifier appears, the respective SHAKE function is used as the hash. The encoding MUST omit the parameters field. That is, the AlgorithmIdentifier SHALL be a SEQUENCE of one component, the OID id-ecdsa-with-shake128 or id-ecdsa-with-shake256.

For simplicity and compliance with the ECDSA standard specification, the output size of the hash function must be explicitly determined. The output size, \(d\), for SHAKE128 or SHAKE256 used in ECDSA MUST be 256 or 512 bits respectively.

It is RECOMMENDED that conforming implementations that generate ECDSA with SHAKE signatures in CMS generate such signatures with a deterministically generated, non-random \(k\) in accordance with all the requirements specified in [RFC6979]. They MAY also generate such signatures in accordance with all other recommendations in [X9.62] or [SEC1] if they have a stated policy that requires conformance to these standards.

### 4.3. Public Keys

In CMS, the signer’s public key algorithm identifiers are located in the OriginatorPublicKey’s algorithm attribute. The conventions and encoding for RSASSA-PSS and ECDSA public keys algorithm identifiers are as specified in Section 2.3 of [RFC3279], Section 3.1 of [RFC4055] and Section 2.1 of [RFC5480].

Traditionally, the rsaEncryption object identifier is used to identify RSA public keys. The rsaEncryption object identifier continues to identify the public key when the RSA private key owner does not wish to limit the use of the public key exclusively to RSASSA-PSS with SHAKEs. When the RSA private key owner wishes to limit the use of the public key exclusively to RSASSA-PSS, the
AlgorithmIdentifier for RSASSA-PSS defined in Section 3 SHOULD be used as the algorithm attribute in the OriginatorPublicKey sequence. Conforming client implementations that process RSASSA-PSS with SHAKE public keys in CMS messages MUST recognize the corresponding OIDs in Section 3.

Conforming implementations MUST specify and process the algorithms explicitly by using the OIDs specified in Section 3 when encoding ECDSA with SHAKE public keys in CMS messages.

The identifier parameters, as explained in Section 3, MUST be absent.

4.4. Message Authentication Codes

KMAC message authentication code (KMAC) is specified in [SP800-185]. In CMS, KMAC algorithm identifiers are located in the AuthenticatedData macAlgorithm field. The KMAC values are located in the AuthenticatedData mac field.

When the id-KmacWithSHAKE128 or id-KmacWithSHAKE256 OID is used as the MAC algorithm identifier, the parameters field is optional (absent or present). If absent, the SHAKE256 output length used in KMAC is 256 or 512 bits respectively and the customization string is an empty string by default.

Conforming implementations that process KMACs with the SHAKEs when processing CMS data MUST recognize these identifiers.

When calculating the KMAC output, the variable N is 0xD2B282C2, S is an empty string, and L, the integer representing the requested output length in bits, is 256 or 512 for KmacWithSHAKE128 or KmacWithSHAKE256 respectively in this specification.

5. IANA Considerations

One object identifier for the ASN.1 module in Appendix A was assigned in the SMI Security for S/MIME Module Identifiers (1.2.840.113549.1.9.16.0) registry:

CMSAlgsForSHAKE-2019 { iso(1) member-body(2) us(840)
  rsadsi(113549) pkcs(1) pkcs-9(9) smime(16) modules(0)
  id-mod-cms-shakes-2019(TBD) }

6. Security Considerations

This document updates [RFC3370]. The security considerations section of that document applies to this specification as well.
NIST has defined appropriate use of the hash functions in terms of the algorithm strengths and expected time frames for secure use in Special Publications (SPs) [SP800-78-4] and [SP800-107]. These documents can be used as guides to choose appropriate key sizes for various security scenarios.

When more than two parties share the same message-authentication key, data origin authentication is not provided. Any party that knows the message-authentication key can compute a valid MAC, therefore the content could originate from any one of the parties.

7. Acknowledgements

This document is based on Russ Housley’s draft [I-D.housley-lamps-cms-sha3-hash]. It replaces SHA3 hash functions by SHAKE128 and SHAKE256 as the LAMPS WG agreed.

The authors would like to thank Russ Housley for his guidance and very valuable contributions with the ASN.1 module. Valuable feedback was also provided by Eric Rescorla.
