YANG Data Model for OSPF Protocol
draft-ietf-ospf-yang-17

Abstract

This document defines a YANG data model that can be used to configure and manage OSPF. The model is based on YANG 1.1 as defined in RFC 7950 and conforms to the Network Management Datastore Architecture (NDMA) as described in RFC 8342.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 16, 2019.

1. Overview

YANG [RFC6020][RFC7950] is a data definition language used to define
the contents of a conceptual data store that allows networked devices
to be managed using NETCONF [RFC6241]. YANG is proving relevant
beyond its initial confines, as bindings to other interfaces (e.g.,
ReST) and encodings other than XML (e.g., JSON) are being defined.
Furthermore, YANG data models can be used as the basis for
implementation of other interfaces, such as CLI and programmatic
APIs.

This document defines a YANG data model that can be used to configure
and manage OSPF and it is an augmentation to the core routing data
model. If fully conforms to the Network Management Datastore
Architecture (NDMA) [RFC8342]. A core routing data model is defined
in [RFC8349], and it provides the basis for the development of data
models for routing protocols. The interface data model is defined in [RFC8343] and is used for referencing interfaces from the routing protocol. The key-chain data model used for OSPF authentication is defined in [RFC8177] and provides both a reference to configured key-chains and an enumeration of cryptographic algorithms.

Both OSPFv2 [RFC2328] and OSPFv3 [RFC5340] are supported. In addition to the core OSPF protocol, features described in other OSPF RFCs are also supported. These includes demand circuit [RFC1793], traffic engineering [RFC3630], multiple address family [RFC5838], graceful restart [RFC3623] [RFC5187], NSSA [RFC3101], and OSPF(v3) as a PE-CE Protocol [RFC4577], [RFC6565]. These non-core features are optional in the OSPF data model.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

1.2. Tree Diagrams

This document uses the graphical representation of data models defined in [RFC8340].

2. Design of Data Model

Although the basis of OSPF configuration elements like routers, areas, and interfaces remains the same, the detailed configuration model varies among router vendors. Differences are observed in terms of how the protocol engine is tied to the routing domain, how multiple protocol engines are be instantiated among others.

The goal of this document is to define a data model that provides a common user interface to the OSPFv2 and OSPFv3 protocols. There is very little information that is designated as "mandatory", providing freedom for vendors to adapt this data model to their respective product implementations.

2.1. OSPF Operational State

The OSPF operational state is included in the same tree as OSPF configuration consistent with Network Management Datastore Architecture [RFC8342]. Consequently, only the routing container in the ietf-routing model [RFC8349] is augmented. The routing-state container is not augmented.
2.2. Overview

The OSPF YANG module defined in this document has all the common building blocks for the OSPF protocol.

The OSPF YANG module augments the /routing/control-plane-protocols/control-plane-protocol path defined in the ietf-routing module.

module: ietf-ospf
  augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol:
      +--rw ospf
        .
        +--rw operation-mode? identityref
        +--rw af? identityref
          .
          +--rw areas
            +--rw area* [area-id]
              +--rw area-id area-id-type
                .
                +--rw virtual-links
                  +--rw virtual-link* [transit-area-id router-id]
                    .
                    +--rw sham-links {pe-ce-protocol}?
                      +--rw sham-link* [local-id remote-id]
                        .
                        +--rw interfaces
                          +--rw interface* [name]
                            .
                            +--rw topologies {multi-topology}?
                              +--rw topology* [name]
                                .

The ospf module is intended to match to the vendor specific OSPF configuration construct that is identified by the local identifier 'name'. The field 'version' allows support for OSPFv2 and OSPFv3.

The ospf container includes one OSPF protocol engine instance. The instance includes OSPF router level configuration and operational state.
The area and area/interface containers respectively define the OSPF configuration and operational state for OSPF areas and interfaces.

The topology container defines the OSPF configuration and operational state for OSPF topologies when the multi-topology feature is supported.

2.3. OSPFv2 and OSPFv3

The data model defined herein supports both OSPFv2 and OSPFv3.

The field ‘version’ is used to indicate the OSPF version and is mandatory. Based on the configured version, the data model varies to accommodate the differences between OSPFv2 and OSPFv3.

2.4. Optional Features

Optional features are beyond the basic OSPF configuration and it is the responsibility of each vendor to decide whether to support a given feature on a particular device.

This model defines the following optional features:

1. multi-topology: Support Multiple-Topology Routing (MTR) [RFC4915].
2. multi-area-adj: Support OSPF multi-area adjacency [RFC5185].
4. demand-circuit: Support OSPF demand circuits [RFC1793].
5. mtu-ignore: Support disabling OSPF Database Description packet MTU mismatch checking.
6. lls: Support OSPF link-local signaling (LLS) [RFC5613].
7. prefix-suppression: Support OSPF prefix advertisement suppression [RFC6860].
8. ttl-security: Support OSPF Time to Live (TTL) security check suppression [RFC5082].
10. graceful-restart: Support Graceful OSPF Restart [RFC3623], [RFC5187].
11. admin-control: Support Administrative control of the protocol state.

12. auto-cost: Support OSPF interface cost calculation according to reference bandwidth [RFC2328].

13. max-ecmp: Support configuration of the maximum number of Equal-Cost Multi-Path (ECMP) paths.

14. max-lsa: Support configuration of the maximum number of LSAs the OSPF instance will accept [RFC1765].

15. te-rid: Support configuration of the Traffic Engineering (TE) Router-ID [RFC3630], [RFC5329].

16. ldp-igp-sync: Support LDP IGP synchronization [RFC5443].

17. ospfv3-authentication-ipsec: Support IPsec for OSPFv3 authentication [RFC4552].

18. fast-reroute: Support IP Fast Reroute (IP-FRR) [RFC5714].

19. node-flag: Support node-flag for OSPF prefixes. [RFC7684].

20. node-tag: Support node admin tag for OSPF instances [RFC7777].

21. lfa: Support Loop-Free Alternates (LFAs) [RFC5286].

22. remote-lfa: Support Remote Loop-Free Alternates (R-LFA) [RFC7490].

23. stub-router: Support RFC 6987 OSPF Stub Router advertisement [RFC6987].

24. pe-ce-protocol: Support OSPF as a PE-CE protocol [RFC4577], [RFC6565].

25. ietf-spf-delay: Support IETF SPF delay algorithm [RFC8405].

26. bfd: Support BFD detection of OSPF neighbor reachability [RFC5880], [RFC5881], and [I-D.ietf-bfd-yang].

It is expected that vendors will support additional features through vendor-specific augmentations.
2.5. OSPF Router Configuration/Operational State

The ospf container is the top level container in this data model. It represents an OSPF protocol engine instance and contains the router level configuration and operational state. The operational state includes the instance statistics, IETF SPF delay statistics, AS Scoped Link State Database, local RIB, SPF Log, and the LSA log.

2.7. OSPF Interface Configuration/Operational State

The interface container contains OSPF interface configuration and operational state. The interface operational state includes the statistics, list of neighbors, and Link-Local Link State Database (LSDB).

2.9. OSPF RPC Operations

The "ietf-ospf" module defines two RPC operations:

- clear-database: reset the content of a particular OSPF Link State Database.

- clear-neighbor: restart a particular set of OSPF neighbor.

rpcs:
   ++-x clear-neighbor
      ++-w input
         +++-w routing-protocol-name
            + -> /rt:routing/control-plane-protocols/
            + control-plane-protocol/name
            +++-w interface? if:interface-ref
   ++-x clear-database
      ++-w input
         +++-w routing-protocol-name
            -> /rt:routing/control-plane-protocols/
            control-plane-protocol/name
3. OSPF YANG Module

The following RFCs and drafts are not referenced in the document text but are referenced in the ietf-ospf.yang module: [RFC0905], [RFC4576], [RFC5250], [RFC5881], [RFC6991], [RFC7770], and [RFC8294].

description
    "This YANG module defines the generic configuration and operational state for the OSPF protocol common to all vendor implementations. It is intended that the module will be extended by vendors to define vendor-specific OSPF configuration parameters and policies, for example route maps or route policies.

This YANG model conforms to the Network Management Datastore Architecture (NDMA) as described in RFC 8242.

4. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a pre-configured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in ietf-ospf.yang module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. For OSPF, the ability to modify OSPF configuration will allow the entire OSPF domain to be compromised including peering with unauthorized routers to misroute traffic or mount a massive Denial-of-Service (DoS) attack. The security considerations of OSPFv2 [RFC2328] and [RFC5340] apply to the ietf-ospf.yang module as well.
Some of the readable data nodes in the ietf-ospf.yang module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. The exposure of the Link State Database (LSDB) will expose the detailed topology of the network. This may be undesirable since both due to the fact that exposure may facilitate other attacks. Additionally, network operators may consider their topologies to be sensitive confidential data.

For OSPF authentication, configuration is supported via the specification of key-chains [RFC8177] or the direct specification of key and authentication algorithm. Hence, authentication configuration using the "auth-table-trailer" case in the "authentication" container inherits the security considerations of [RFC8177]. This includes the considerations with respect to the local storage and handling of authentication keys.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. The OSPF YANG module support the "clear-neighbor" and "clear-database" RPCs. If access too either of these is compromised, they can result in temporary network outages be employed to mount DoS attacks.

5. IANA Considerations

This document registers a URI in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made:

- Registrant Contact: The IESG.
- XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [RFC6020].

- name: ietf-ospf
- prefix: ospf
- reference: RFC XXXX

6. Acknowledgements

The authors wish to thank Yi Yang, Alexander Clemm, Gaurav Gupta, Ladislav Lhotka, Stephane Litkowski, Greg Hankins, Manish Gupta and Alan Davey for their thorough reviews and helpful comments.
