Abstract

This document describes the TinyMT32 Pseudo Random Number Generator (PRNG) that produces 32-bit pseudo-random unsigned integers and aims at having a simple-to-use and deterministic solution. This PRNG is a small-sized variant of Mersenne Twister (MT) PRNG, also designed by M. Saito and M. Matsumoto. The main advantage of TinyMT32 over MT is the use of a small internal state, compatible with most target platforms including embedded devices, while keeping a reasonably good randomness.
This document specifies the TinyMT32 PRNG, as a specialization of the reference implementation version 1.1 (2015/04/24) by Mutsuo Saito and Makoto Matsumoto, from Hiroshima University:

- Official web site: <http://www.math.sci.hiroshima-u.ac.jp/~m-mat/MT/TINYMT/>
- Official github site and reference implementation: <https://github.com/MersenneTwister-Lab/TinyMT>

This specialisation aims at having a simple-to-use and deterministic PRNG, as explained below.

TinyMT is a new small-sized variant of Mersenne Twister (MT) introduced by Mutsuo Saito and Makoto Matsumoto in 2011. This document focusses on the TinyMT32 variant (rather than TinyMT64) of the PRNG, which outputs 32-bit unsigned integers.

The purpose of TinyMT is not to replace Mersenne Twister: TinyMT has a far shorter period than MT. The merit of TinyMT is in its small size of the internal state of 127 bits, far smaller than 19937 bits of MT. According to statistical tests (BigCrush in TestU01 <http://simul.iro.umontreal.ca/testu01/tu01.html> and AdaptiveCrush
<http://www.math.sci.hiroshima-u.ac.jp/~m-mat/MT/ADAPTIVE/> the quality of the outputs of TinyMT seems pretty good, taking the small size of the internal state into consideration. From this point of view, TinyMT32 represents a major improvement with respect to the Park-Miler Linear Congruential PRNG (e.g., as specified in [RFC5170]).

The TinyMT32 PRNG initialization depends, among other things, on a parameter set -- namely (mat1, mat2, tmat) -- that needs to be well chosen (pre-calculated values are available in the official web site). In order to facilitate the use of this PRNG, and unlike the implementation version 1.1 (2015/04/24) by Mutsuo Saito and Makoto Matsumoto, this specification requires the use of a specific parameter set (see Section 3.1). The implementation version 1.1 (2015/04/24) also proposes two initialisation functions that differ on the approach to seed the PRNG. A second difference is the removal of the tinymt32_init_by_array() function to keep only the simple initialisation through a single seed value (see Section 3.2).

Finally, the determinism of this PRNG, for a given seed, has been carefully checked (see Section 3.3). Indeed, this determinism can be a key requirement as it is the case with [RLC-ID] that normatively depends on this specification.

2. Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. TinyMT32 PRNG Specification

3.1. TinyMT32 Source Code

The TinyMT32 PRNG requires to be initialized with a parameter set that needs to be well chosen. In this specification, for the sake of simplicity, the following parameter set MUST be used:

- mat1 = 0x8f7011ee = 2406486510
- mat2 = 0xfc78ff1f = 4235788063
- tmat = 0x3793fdff = 932445695

This parameter set is the first entry of the precalculated parameter sets in file tinymt32dc.0.1048576.txt, by Kenji Rikitake, and available at <https://github.com/jj1bdx/tinymtdc-
The TinyMT32 PRNG reference implementation is reproduced in Figure 1, with the following differences with respect to the original source code:

- The original copyright and license have been removed, in accordance with BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (http://trustee.ietf.org/license-info);
- The source code initially spread over the tinymt32.h and tinymt32.c files has been merged;
- The unused parts of the original source code have been removed. This is the case of the tinymt32_init_by_array() alternative initialization function;
- The unused constants TINYMT32_MEXP and TINYMT32_MUL have been removed;
- The appropriate parameter set has been added to the initialization function;
- The function order has been changed;
- Certain internal variables have been renamed for compactness purposes;
- The const qualifier has been added to the constant definitions.

```c
/**
 * Tiny Mersenne Twister only 127 bit internal state.
 * Derived from the reference implementation version 1.1 (2015/04/24)
 * by Mutsuo Saito (Hiroshima University) and Makoto Matsumoto
 * (Hiroshima University).
 */
#include <stdint.h>

/**
 * tinymt32 internal state vector and parameters
 */
typedef struct {
    uint32_t status[4];
    uint32_t mat1;
    uint32_t mat2;
    uint32_t tmat;
} tinymt32_t;

static void tinymt32_next_state (tinymt32_t * s);
static uint32_t tinymt32_temper (tinymt32_t * s);

/**
 * Parameter set to use for this IETF specification. Don't change.
 */
```
This parameter set is the first entry of the precalculated parameter sets in file tinymt32dc.0.1048576.txt, by Kenji Rikitake, available at:
https://github.com/jj1bdx/tinymt3dc-longbatch/blob/master/tinymt32dc/tinymt32dc.0.1048576.txt
It is also the parameter set used:

const uint32_t  TINYMT32_MAT1_PARAM = UINT32_C(0x8f7011ee);
const uint32_t  TINYMT32_MAT2_PARAM = UINT32_C(0xfc78ff1f);
const uint32_t  TINYMT32_TMAT_PARAM = UINT32_C(0x3793fdff);

/**
 * This function initializes the internal state array with a 32-bit unsigned integer seed.
 * @param s pointer to tinymt internal state.
 * @param seed a 32-bit unsigned integer used as a seed.
 */
void tinymt32_init (tinymt32_t * s, uint32_t seed)
{
    const uint32_t    MIN_LOOP = 8;
    const uint32_t    PRE_LOOP = 8;
    s->status[0] = seed;
    s->status[1] = s->mat1 = TINYMT32_MAT1_PARAM;
    s->status[2] = s->mat2 = TINYMT32_MAT2_PARAM;
    for (int i = 1; i < MIN_LOOP; i++) {
        s->status[i & 3] ^= i + UINT32_C(1812433253)
                     ^ (s->status[(i - 1) & 3] >> 30));
    }
    /*
    * NB: the parameter set of this specification warrants
    * that none of the possible 2^^32 seeds leads to an all-zero 127-bit internal state. Therefore, the
    * period_certification() function of the original TinyMT32 source code has been safely removed. If
    * another parameter set is used, this function will have to be re-introduced here.
    */
    for (int i = 0; i < PRE_LOOP; i++) {
        tinymt32_next_state(s);
    }
}
/**
* This function outputs a 32-bit unsigned integer from
* the internal state.
* @param s     pointer to tinymt internal state.
* @return      32-bit unsigned integer r (0 <= r < 2^32).
*/
uint32_t tinymt32_generate_uint32 (tinymt32_t * s)
{
    tinymt32_next_state(s);
    return tinymt32_temper(s);
}

/**
* Internal tinymt32 constants and functions.
* Users should not call these functions directly.
*/
const uint32_t  TINYMT32_SH0 = 1;
const uint32_t  TINYMT32_SH1 = 10;
const uint32_t  TINYMT32_SH8 = 8;
const uint32_t  TINYMT32_MASK = UINT32_C(0xffffffff);

/**
* This function changes the internal state of tinymt32.
* @param s     pointer to tinymt internal state.
*/
static void tinymt32_next_state (tinymt32_t * s)
{
    uint32_t x;
    uint32_t y;

    y = s->status[3];
    x = (s->status[0] & TINYMT32_MASK)
        ^ s->status[1]
        ^ s->status[2];
    x ^= (x << TINYMT32_SH0);
    y ^= (y >> TINYMT32_SH0) ^ x;
    s->status[0] = s->status[1];
    s->status[1] = s->status[2];
    s->status[2] = x ^ (y << TINYMT32_SH1);
    s->status[3] = y;
    /*
     * The if (y & 1) {...} block below replaces:
     * s->status[1] ^= -((int32_t)(y & 1)) & s->mat1;
     * s->status[2] ^= -((int32_t)(y & 1)) & s->mat2;
     * The adopted code is equivalent to the original code
     * but does not depend on the representation of negative
     * integers by 2’s complements. It is therefore more
     * portable, but includes an if-branch which may slow
     * down the generation speed.
if (y & 1) {
    s->status[1] ^= s->mat1;
    s->status[2] ^= s->mat2;
}

/**
 * This function outputs a 32-bit unsigned integer from
 * the internal state.
 * @param s     pointer to tinymt internal state.
 * @return      32-bit unsigned pseudo-random number.
 */
static uint32_t tinymt32_temper (tinymt32_t * s) {
    uint32_t t0, t1;
    t0 = s->status[3];
    t1 = s->status[0] + (s->status[2] >> TINYMT32_SH8);
    t0 ^= t1;
    t0 ^= -((int32_t)(t1 & 1)) & s->tmat;
    return t0;
}

Figure 1: TinyMT32 Reference Implementation

3.2. TinyMT32 Usage

This PRNG MUST first be initialized with the following function:

void tinymt32_init (tinymt32_t * s, uint32_t seed);

It takes as input a 32-bit unsigned integer used as a seed (note that
value 0 is authorized by TinyMT32). This function also takes as
input a pointer to an instance of a tinymt32_t structure that needs
to be allocated by the caller but left uninitialized. This structure
will then be updated by the various TinyMT32 functions in order to keep
the internal state of the PRNG. The use of this structure authorizes
several instances of this PRNG to be used in parallel, each of them
having its own instance of the structure.

Then, each time a new 32-bit pseudo-random unsigned integer between 0
and 2^32 - 1 inclusive is needed, the following function is used:

uint32_t tinymt32_generate_uint32 (tinymt32_t * s);

Of course, the tinymt32_t structure must be left unchanged by the
caller between successive calls to this function.
3.3. Specific Implementation Validation and Deterministic Behavior

PRNG determinism, for a given seed, can be a requirement (e.g., with [RLC-ID]). Consequently, any implementation of the TinyMT32 PRNG in line with this specification MUST comply with the following criteria. Using a seed value of 1, the first 50 values returned by tinymt32_generate_uint32(s) as 32-bit unsigned integers MUST be equal to values provided in Figure 2. Note that these values come from the tinymt/check32.out.txt file provided by the PRNG authors to validate implementations of TinyMT32, as part of the MersenneTwister-Lab/TinyMT Github repository.

Figure 2: First 50 decimal values returned by tinymt32_generate_uint32(s) as 32-bit unsigned integers, with a seed value of 1.

In particular, the deterministic behavior of the Figure 1 source code has been checked across several platforms: high-end laptops running 64-bits Mac OSX and Linux/Ubuntu; a board featuring a 32-bits ARM Cortex-A15 and running 32-bit Linux/Ubuntu; several embedded cards featuring either an ARM Cortex-M0+, a Cortex-M3 or a Cortex-M4 32-bit microcontroller, all of them running RIOT [Baccelli18]; two low-end embedded cards featuring either a 16-bit microcontroller (TI MSP430) or a 8-bit microcontroller (Arduino ATMEGA2560), both of them running RIOT.

This specification only outputs 32-bit unsigned pseudo-random numbers and does not try to map this output to a smaller integer range (e.g., between 10 and 49 inclusive). If a specific use-case needs such a mapping, it will have to provide its own function. In that case, if PRNG determinism is also required, the use of floating point (single or double precision) to perform this mapping should probably be avoided, these calculations leading potentially to different rounding errors across different target platforms. Great care should also be put on not introducing biases in the randomness of the mapped output (it may be the case with some mapping algorithms) incompatible with...
the use-case requirements. The details of how to perform such a mapping are out-of-scope of this document.

4. Security Considerations

The authors do not believe the present specification generates specific security risks per se.

5. IANA Considerations

This document does not require any IANA action.

6. Acknowledgments

The authors would like to thank Belkacem Teibi with whom we explored TinyMT32 specificities when looking to an alternative to the Park–Miler Linear Congruential PRNG. The authors would like to thank the three TSVWG chairs, Wesley Eddy, our shepherd, David Black and Gorry Fairhurst, as well as Spencer Dawkins and Mirja Kuhlewind. Last but not least, the authors are really grateful to the IESG members, in particular Benjamin Kaduk, Eric Rescorla, and Adam Roach for their highly valuable feedbacks that greatly contributed to improve this specification.
